

organic light emitting devices pdf

A flexible organic light-emitting diode (FOLED) is a type of organic light-emitting diode (OLED) incorporating a flexible plastic substrate on which the electroluminescent organic semiconductor is deposited. This enables the device to be bent or rolled while still operating. Currently the focus of research in industrial and academic groups, flexible OLEDs form one method of fabricating a ...

Flexible organic light-emitting diode - Wikipedia

An organic light-emitting diode (OLED) is a light-emitting diode (LED) in which the emissive electroluminescent layer is a film of organic compound that emits light in response to an electric current. This organic layer is situated between two electrodes; typically, at least one of these electrodes is transparent. OLEDs are used to create digital displays in devices such as television screens ...

OLED - Wikipedia

As shown schematically in Fig. 1, EL in organic solids requires several steps including the injection, transport, capture and radiative recombination of positive and negative charge carriers inside an organic layer with suitable energy gap to yield visible light output. For simplicity we have drawn the spatial variation of the molecular energy levels in a band-like fashion, however, we have to ...

Device physics of organic light-emitting diodes based on

OLED devices operate when the energy, which is generated by carrying electrons and holes away respectively in the functional organic thin film layers, recombine in a light emitting layer.

Organic Light-Emitting Diode (OLED) | Futaba Corporation

Organic light emitting diodes (OLEDs) have rapidly developed over the last decade because of their potential applications in flat-panel displays, domestic solid state lighting etc.

A review on the light extraction techniques in organic

Organic Electronics Materials, Physics, Chemistry and Applications Organic Electronics is a journal whose primary interdisciplinary focus is on...

Organic Electronics - Journal - Elsevier

Introduction: The LED is a light source which uses semiconductors and electroluminescence to create light. There are two major kinds of light emitting diodes: LED and OLED. The LED is different than EL lamp in that it uses a small semiconductor crystal with reflectors and other parts to make the light brighter and focused into a single point.

LED Lights - How it Works - History - Edison Tech Center

The Cover Feature shows the transformation of a bis-phosphonium ylide molecule to a medium-sized cyclic olefin under visible-light activation. The photoredox activation of ylides features an umpolung reactivity of the classical nucleophile in coupling reactions with other ylide partners.
